

ABSTRACT OF THE DISCLOSURE

The object of the present invention is to provide a color correction apparatus capable of carrying out appropriate color correction, a color correction method, and a recording medium having a color correction control program recorded.

According to the present color correction apparatus for correcting the color image data, a color adjustment amount for canceling a difference between the optimum value (Rt, Gt, Bt) predetermined for the fixed-color pixel and the result of the summing-up is obtained (step 44-50). Therefore, the color adjustment amount is corrected on the basis of the fixed elemental color elements of the pixel, and the color image data is color-corrected on the basis of the corrected color adjustment amount. Since a computing equation for adjustment operation is simple, the processing time can be shortened. Further, since the color adjustment amount is corrected on the basis of the fixed memory color element of each pixel, it is possible to suppress color jumping.
